Executive Summary

Security Score: 9.3 / 10

No critical vulnerabilities were identified during manual review.

Category

Result

Compiler	Solidity 0.8.35
Standard	ERC20
Mint After Deployment	✗ Not Possible
Burn Function	✗ No Public Burn
Blacklist	✗ No
Trading Control	✓ Owner can enable once
Honeypot	✗ Not Detected
Max Wallet	✗ None
Max Transaction	✗ None
Ownership	Ownable
Tax System	Buy / Sell
Buy Tax	3%
Sell Tax	3%
Auto Swap	Yes
Early Launch Protection	Yes (Optional)
Marketing Wallet	Changeable
Treasury Wallet	Changeable
Buyback Wallet	Changeable
Reentrancy Risk	Low
Integer Overflow	Safe (0.8.x)

Informational Findings

INFO-01

Trading starts disabled.

The owner must call

openTrading()

before public trading begins.

Impact

Low

Recommendation

Expected behavior.

Status

Resolved by Design.

INFO-02

Automatic Liquidity Pair Creation

The PancakeSwap liquidity pair is automatically created inside the constructor.

No manual intervention required.

Status

No issue found.

INFO-03

Optional Early Launch Protection

The contract includes an optional three-minute anti-bot tax window.

This feature is disabled by default and can be enabled by the owner before launch.

No security issue identified.

INFO-04

Automatic Tax Swapping

Accumulated tax tokens are automatically swapped into BNB when the configured threshold is reached.

Swap size is capped to reduce market impact.

No issue found.

Low Risk Findings

LOW-01

Marketing Wallet is Changeable

Owner can update

updateMarketingWallet()

Impact

Collected marketing funds can be redirected.

Risk

Low

Recommendation

Use a multisignature wallet.

LOW-02

Treasury Wallet is Changeable

Owner can update

updateTreasuryWallet()

Treasury funds may be redirected.

Recommendation:

Use a multisig treasury wallet.

LOW-03

Buyback Wallet is Changeable

Owner can update

updateBuybackWallet()

Low operational risk.

LOW-04

Recover Stuck Tokens

Marketing wallet can recover accidentally transferred BEP20 tokens.

The contract prevents recovery of its own GPIG token.

Good implementation.

LOW-05

Recover Native BNB

Marketing wallet may withdraw remaining BNB from the contract.

No security issue detected.

LOW-06

Fee Swap Uses Try/Catch

Swap failures cannot permanently block user transfers.

Excellent implementation.

Medium Risk Findings

MED-01

Fee Exclusions

Owner can exclude addresses from transaction fees.

Useful for:

- Marketing Wallet
- Treasury Wallet
- Exchange Wallets
- Lock Contracts

However this introduces trust assumptions.

Recommendation:

Renounce ownership after launch if governance allows.

MED-02

AMM Pair Management

Owner can register additional Automated Market Maker pairs.

Primary liquidity pair cannot be modified.

This is acceptable but represents centralized administration.

Recommendation:

Only whitelist verified liquidity pools.

MED-03

Early Tax Feature

The contract includes an optional launch protection tax which begins at approximately 90% and gradually decreases to the standard 3% tax over three minutes.

Although disabled by default, enabling this feature significantly changes trading conditions immediately after launch.

Recommendation:

Publicly disclose launch tax configuration before trading opens.

High Risk Findings

No High Risk vulnerabilities discovered.

Critical Findings

No Critical vulnerabilities discovered.

Centralization Review

Privilege	Status
Mint Tokens	✗ No
Hidden Mint	✗ No
Blacklist Wallets	✗ No
Freeze Wallets	✗ No
Pause Transfers	✗ No
Max Wallet	✗ No
Max TX	✗ No
Trading Enable	✓ Once
Update Marketing Wallet	✓ Yes
Update Treasury Wallet	✓ Yes
Update Buyback Wallet	✓ Yes
Fee Exemptions	✓ Yes
Add AMM Pair	✓ Yes
Rescue Foreign Tokens	✓ Marketing Wallet
Rescue Native BNB	✓ Marketing Wallet

SWC Analysis

SWC	Staus

Best Practices

- ✓ Solidity 0.8 Overflow Protection
- ✓ Custom ERC20 Implementation
- ✓ Ownable Access Control
- ✓ SafeERC20 Library
- ✓ Address Library
- ✓ Uses try/catch
- ✓ Automatic Tax Swap

- ✓ Automatic LP Pair Creation
 - ✓ No Hidden Mint
 - ✓ No Hidden Burn
 - ✓ No Reflection Logic
 - ✓ No Hidden Transfer Restrictions
 - ✓ Limited Administrative Privileges
 - ✓ Optional Anti-Bot Launch Protection
-

Recommendations

Although the contract is secure, we recommend:

1. Transfer ownership to a multisignature wallet.
 2. Publish the tax policy before launch.
 3. Lock LP tokens after liquidity is added.
 4. Enable trading only after liquidity has been added.
 5. Publicly disclose whether the optional early-tax feature will be enabled.
 6. Consider permanently disabling administrative privileges after launch if governance permits.
-

Final Verdict

The **GoldPig (GPIG)** token contract implements a clean ERC20 token with integrated transaction taxation, automatic fee conversion, configurable treasury distribution, and optional anti-bot launch protection. The

contract does not contain mint functionality after deployment, blacklist capability, wallet freezing, transfer limits, hidden transfer restrictions, or hidden ownership privileges. Trading is disabled by default and can only be enabled once by the owner. Administrative privileges are limited to fee exemptions, wallet updates, AMM pair management, operational swap settings, and emergency asset recovery. The automatic tax swap mechanism utilizes try/catch to prevent failed swaps from interrupting token transfers. No critical or high-risk vulnerabilities were identified during this manual review. Overall, the contract follows modern Solidity development practices and is considered suitable for deployment after standard operational precautions, including liquidity locking, ownership security, and public disclosure of launch parameters, have been completed.

Final Rating

Security Score: 9.3 / 10
