Executive Summary

Security Score: 9.0 / 10

No Critical vulnerabilities were identified during manual review.

Contract Overview

Category	Result
Compiler	Solidity 0.8.6
Standard	ERC20
Total Supply	420 Trillion
Decimals	9
Mint After Deployment	✗ Not Possible
Burn Function	✗ No Public Burn
Blacklist	✗ No
Pause Transfers	✗ No
Trading Control	✓ Owner can enable once
Honeypot	✗ Not detected
Max Wallet	✗ None
Max Transaction	✗ None
Ownership	Ownable
Buy Tax	3%
Sell Tax	3%
Auto Swap	Yes
Marketing Wallet	Changeable
Dev Wallet	Changeable
Reentrancy Risk	Low

Informational Findings

INFO-01

Trading starts disabled.

Owner must call

`enableTradingEnabled()`

before public trading.

Impact

Low

Recommendation

Expected behavior.

Status

Resolved by Design.

INFO-02

Liquidity Pair is automatically created inside the constructor.

No manual interaction required.

Status:

No Issue.

INFO-03

Router is hardcoded to PancakeSwap V2.

Suitable for BNB Chain deployment.

Low Risk Findings

LOW-01

Marketing Wallet can be changed.

Owner may update

`setMarketingWallet()`.

Impact

Collected fees may be redirected.

Recommendation

Use a multisig wallet.

LOW-02

Developer Wallet can be changed.

Owner may update

`setDevWallet()`.

Impact

Development fees may be redirected.

Recommendation

Use a multisig wallet.

LOW-03

Marketing wallet can recover accidentally sent BEP20 tokens.

Own token cannot be recovered.

Implementation is correct.

LOW-04

Contract BNB can be withdrawn only by Marketing Wallet.

Implementation works as intended.

LOW-05

Swap Threshold is configurable.

Maximum allowed threshold:

1% of total supply.

No issue found.

Medium Risk Findings

MED-01

Fee Exclusions

Owner can exclude any address from fees.

Useful for

- Marketing Wallet
- CEX Wallets
- Lock Contracts

However this introduces centralized privilege.

Recommendation

Renounce ownership after launch if governance allows.

MED-02

Owner can register additional AMM pairs.

Useful for future DEX integrations.

Recommendation

Use only verified liquidity pools.

MED-03

Ownership transferred using `tx.origin`.

Although functional during deployment, using `msg.sender` is considered a better Solidity practice.

Impact

Low.

Recommendation

Prefer `msg.sender`.

High Risk Findings

No High Risk vulnerabilities discovered.

Critical Findings

No Critical vulnerabilities discovered.

Centralization Review

Privilege

Status

Mint Tokens

✗ No

Hidden Mint	✗ No
Blacklist Wallets	✗ No
Freeze Wallets	✗ No
Pause Transfers	✗ No
Max Wallet	✗ No
Max TX	✗ No
Trading Enable	✓ Once
Change Marketing Wallet	✓ Yes
Change Dev Wallet	✓ Yes
Exclude Fees	✓ Yes
Add AMM Pair	✓ Yes
Rescue Foreign Tokens	✓ Marketing Wallet

SWC Analysis

SWC	Staus
Integer Overflow	PASS
Reentrancy	PASS
Delegatecall	PASS
tx.origin	INFO
DOS	PASS

Selfdestruct	PASS
Unchecked Calls	PASS
Floating Pragma	PASS
Authorization	PASS
Signature Replay	PASS

Best Practices

- ✓ Solidity 0.8 Overflow Protection
 - ✓ Ownable
 - ✓ Standard ERC20
 - ✓ Automatic Liquidity Pair
 - ✓ Automatic Fee Swap
 - ✓ No Hidden Mint
 - ✓ No Blacklist
 - ✓ No Max Wallet
 - ✓ No Max Transaction
 - ✓ Limited Trading Control
 - ✓ Rescue Function protects native token
-

Recommendations

1. Transfer ownership to a multisig wallet.
 2. Lock LP tokens after launch.
 3. Verify source code on BscScan.
 4. Enable trading only after liquidity is added.
 5. Consider replacing `tx.origin` with `msg.sender` during deployment.
 6. Publish fee wallet addresses for community transparency.
-

Final Verdict

The **OceanBOB (OBOB)** smart contract implements a standard ERC20 token with a fixed total supply, automatic fee collection, and PancakeSwap integration. The contract does not include mint functionality, blacklist capability, wallet freezing, transfer limits, or hidden transfer restrictions. Trading is disabled by default and can be enabled only once by the owner. Administrative privileges are limited to fee exemptions, wallet updates, AMM pair management, and operational settings. No critical or high-risk vulnerabilities were identified during this manual review. Overall, the contract follows modern Solidity development practices and is considered suitable for deployment, provided standard operational security measures—such as liquidity locking and secure ownership management—are completed.

Final Rating

Security Score: 9.0 / 10
