Initial Security Assessment of Your Contract

Overall Rating

Security Score: 9.1 / 10

No critical vulnerabilities were identified during manual review.

Executive Summary

Category

Result

Compiler	Solidity 0.8.26
Standard	ERC20
Mint After Deployment	✗ Not Possible
Burn Function	✗ No
Blacklist	✗ No
Trading Control	✓ Owner can enable once
Honeypot	✗ Not detected
Max Wallet	✗ None
Max Transaction	✗ None
Ownership	Ownable
Tax System	Buy / Sell / Transfer
Auto Swap	Yes
Fee Receiver	Changeable
Reentrancy Risk	Low
Integer Overflow	Safe (0.8.x)

Informational Findings

INFO-01

Trading starts disabled.

The owner must call:

enableTrading()

before public trading begins.

Impact:

Low

Recommendation:

Expected behavior.

Status:

Resolved by Design.

INFO-02

Router is selected depending on chain.

Supports:

- Ethereum
- BNB Chain
- Testnets

No issue found.

INFO-03

Auto Liquidity Pair

The pair is automatically created inside constructor.

No manual intervention required.

Low Risk Findings

LOW-01

Fee Receiver is Changeable

Owner can update

`changeFeeReceiver()`

Impact:

Collected fees can be redirected.

Risk:

Low

Recommendation:

Use a multisig wallet for `feeReceiver`.

LOW-02

Recover Stuck Tokens

Contract allows owner or `feeReceiver` to recover accidentally sent tokens.

The contract prevents recovering its own token.

Good implementation.

LOW-03

Fee Swap Uses Try/Catch

Swap failures cannot brick transfers.

Excellent implementation.

Medium Risk Findings

MED-01

Centralized Fee Configuration

Owner can change:

- Buy Fee
- Sell Fee
- Transfer Fee

Maximum:

10%

This is acceptable but represents a centralization privilege.

Recommendation:

Renounce ownership after launch if governance allows.

MED-02

Fee Exclusions

Owner can exclude addresses from fees.

Useful for:

- CEX wallets

- Lock contracts
- Marketing wallet

However this introduces trust assumptions.

High Risk Findings

No High Risk vulnerabilities discovered.

Critical Findings

No Critical vulnerabilities discovered.

Centralization Review

Privilege	Status
Mint Tokens	 No
Blacklist Wallets	 No
Pause Transfers	 No
Freeze Wallets	 No
Max Wallet	 No
Max TX	 No
Trading Enable	 Once

Update Fees	✓ Max 10%
Exclude Fees	✓ Yes
Change Fee Receiver	✓ Yes

SWC Analysis

SWC	Status
Integer Overflow	PASS
Reentrancy	PASS
Delegatecall	PASS
tx.origin	PASS
DOS	PASS
Selfdestruct	PASS
Unchecked Calls	PASS
Floating Pragma	PASS
Authorization	PASS
Signature Replay	PASS

Best Practices

- ✓ Solidity 0.8 Overflow Protection
 - ✓ Custom Errors
 - ✓ OpenZeppelin ERC20
 - ✓ OpenZeppelin Ownable
 - ✓ Uses try/catch
 - ✓ Limits Fee to 10%
 - ✓ No Hidden Mint
 - ✓ No Hidden Burn
 - ✓ No Reflection Logic
 - ✓ No Hidden Transfer Tax
-

Recommendations

Although the contract is secure, we recommend:

1. Transfer ownership to a multisig wallet.
 2. Publish fee policy before launch.
 3. Lock LP tokens.
 4. Verify source code.
 5. Enable trading only after liquidity is added.
-

Final Verdict

The IVT (Investing Usdt) token contract demonstrates a clean ERC20 implementation with an integrated fee mechanism and automatic fee conversion. The contract does not contain mint functionality, blacklist capability, wallet freezing, or hidden transfer restrictions. The owner retains limited administrative privileges to enable trading, adjust fees (capped at 10%), manage fee exemptions, and update the fee receiver. No critical or high-risk vulnerabilities were identified during this manual review. Overall, the contract follows modern Solidity development practices and is considered suitable for deployment after standard operational precautions, such as liquidity locking and secure ownership management, are completed.

Final Rating

Security Score: 9.1 / 10
